

SecurEnvoy The future of authentication

SecurEnvoy is pioneering the authentication space to meet the growing security needs of modern businesses.

Today's organisations need watertight security, particularly now that 'cloud computing' has empowered users to access data any time, from anywhere. However, they also need cost savings, optimum productivity and a renewed focus on environmental action. So SecurEnvoy's ethos is simple: Give control back to businesses and users without compromising on security or access.

Unlike traditional authentication solutions, SecurEnvoy's suite of products can be installed and integrated into existing IT systems quickly. And crucially, they avoid the need for much of the additional cost or remote deployment of the traditional approach to security software, creating an unprecedented zero-footprint solution while ensuring long-term cost benefits.

A global leader in business authentication, SecurEnvoy's products – SecurAccess, SecurPassword, SecurICE and SecurMail – have been adopted by businesses all over the globe.

By strengthening mobile security without breaking business budgets, SecurEnvoy helps you manage risk, maximise reward and retain control of your sensitive data.

SecurMail

Closing the email security gap

Businesses rely on email communications more than ever before – with an increasing amount of sensitive data sent across their networks. But this means corporate security can easily be jeopardised, with confidential data falling into the wrong hands at the click of a mouse.

SecurEnvoy has designed a revolutionary way of sending email securely, using a simple patented approach that bypasses the complexity of traditional certificate based solutions.

With SecurMail, there's no need for a prior relationship, software setup or shared password with your intended recipients – all you need is their email address and mobile number. Once installed, the sender just needs to click the 'send secure' button in their Outlook toolbar.

Using a pioneering combination of twofactor authentication, encryption and SSL technology, SecurMail requires two forms of ID from your intended recipient. When you send an email, the recipient gets a link to a webpage and a passcode via SMS to read it.

In line with SecurEnvoy's zero-footprint approach and hardware philosophy, there's no need for extra devices or additional PINs. SecurMail is the foolproof way to ensure your email gets to the right person, securely.

SecurMail is changing the game for email security. No tokens, no software, no fuss... Just rock-solid, two-factor security to give you 100% confidence in your business communication.

Benefits

- No need to enroll or agree in advance to receive sensitive data
- No additional devices or passwords required by the recipient
- Compatible with any recipient email environment
- Guaranteed notification that the email has been received
- Doesn't get blocked by virus scanners and works with webmail

Requirements

- Windows 2000, 2003 or 2008 server with IIS installed
- SMS provision via modem with SIM chip or a web SMS Gateway provider
- A Public Trusted Web SSL Certificate
